

WORKSHEET 5 SQL

Refer the following ERD and answer all the questions in this worksheet. You have to write the queries using MySQL for the required Operation.

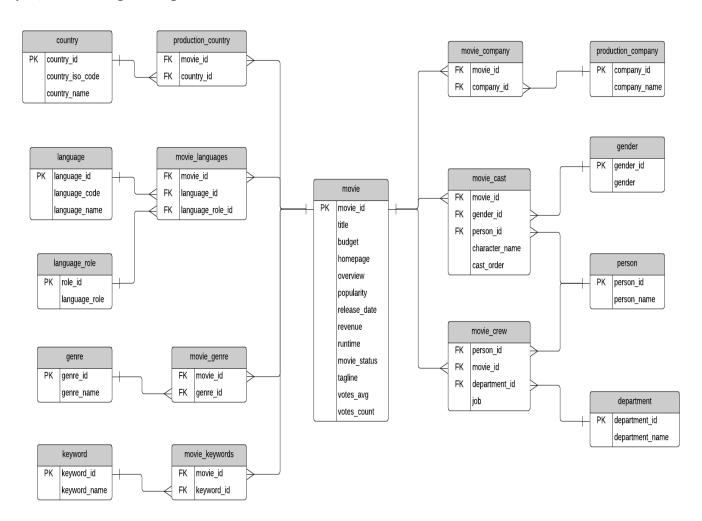

Table Explanations:

- The **movie** table contains information about each movie. There are text descriptions such as title and overview. Some fields are more obvious than others: revenue (the amount of money the movie made), budget (the amount spent on creating the movie). Other fields are calculated based on data used to create the data source: popularity, votes_avg, and votes_count. The status indicates if the movie is Released, Rumoured, or in Post-Production.
- The **country** list contains a list of different countries, and the **movie_country** table contains a record of which countries a movie was filmed in (because some movies are filmed in multiple countries). This is a standard many-to-many table, and you'll find these in a lot of databases.
- The same concept applies to the **production_company** table. There is a list of production companies and a many-to-many relationship with movies which is captured in the **movie_company** table.
- The **languages** table has a list of languages, and the **movie_languages** captures a list of languages in a movie. The difference with this structure is the addition of a **language_role** table.
- This **language_role** table contains two records: Original and Spoken. A movie can have an original language (e.g. English), but many Spoken languages. This is captured in the **movie_languages** table along with a role.
- **Genres** define which category a movie fits into, such as Comedy or Horror. A movie can have multiple genres, which is why the **movie genres** table exists.

- The same concept applies to **keywords**, but there are a lot more keywords than genres. I'm not sure what qualifies as a keyword, but you can explore the data and take a look. Some examples as "paris", "gunslinger", or "saving the world".
- The cast and crew section of the database is a little more complicated. Actors, actresses, and crew members are all people, playing different roles in a movie. Rather than have separate lists of names for crew and cast, this database contains a table called **person**, which has each person's name.
- The **movie_cast** table contains records of each person in a movie as a cast member. It has their character name, along with the **cast_order**, which I believe indicates that lower numbers appear higher on the cast list.
- The **movie_cast** table also links to the gender table, to indicate the gender of each character. The gender is linked to the **movie_cast** table rather than the **person** table to cater for characters which may be a different gender than the person, or characters of unknown gender. This means that there is no gender table linked to the **person** table, but that's because of the sample data.
- The **movie_crew** table follows a similar concept and stores all crew members for all movies. Each crew member has a job, which is part of a **department** (e.g. Camera).

QUESTIONS:

1. Write SQL query to show all the data in the Movie table.

Ans:- select * from movie;

2. Write SQL query to show the title of the longest runtime movie.

Ans:- select title from movie where runtime=(select max(runtime) from movie)

3. Write SQL query to show the highest revenue generating movie title.

Ans:- select title from movie where revenue=(select max(revenue) from movie);

4. Write SQL query to show the movie title with maximum value of revenue/budget.

Ans:- select title,max(revenue),max(budget) from movie;

5. Write a SQL query to show the movie title and its cast details like name of the person, gender, charactername, cast order.

Ans:- select movie.title,person.person_name,gender.gender,movie_cast.character_name,movie_cast.cast_ order from movie join movie_cast on movie_cast.movie_id=movie.movie_id join gender on movie cast.gender id=gender.gender id join person on movie cast.person id=person.person id;

6. Write a SQL query to show the country name where maximum number of movies has been produced, along with the number of movies produced.

Ans:- select country_country_name,count(movie.title) as 'no of movie produced' from country join production_country on production_country.country_id=country.country_id join movie on production_country.movie_id=movie.movie_id order by 'no of movie produced' desc limit 1;

7. Write a SQL query to show all the genre id in one column and genre name in second column.

Ans:- select * from genre;

8. Write a SQL query to show name of all the languages in one column and number of movies in that particular column in another column.

Ans:- select language.language_name, movie.title as 'movie name' from movie join movie_languages on movie_languages.movie_id=movie.movie_id join language on movie_languages.language_id=language.language_id;

9. Write a SQL query to show movie name in first column, no. of crew members in second column and number of cast members in third column.

Ans:- select movie.title,count(person.person_name) as 'no of crew members', count(movie_cast.character_name) as 'no of casting members' from person join movie_cast on movie_cast.person_id=person.person_id join movie on movie_cast.movie_id=movie.movie_id;

10. Write a SQL query to list top 10 movies title according to popularity column in decreasing order.

Ans:- select title from movie order by popularity desc limit 10;

11. Write a SQL query to show the name of the 3rd most revenue generating movie and its revenue.

Ans:- select title, revenue from movie order by revenue desc limit 1 offset 2;

12. Write a SQL query to show the names of all the movies which have "rumoured" movie status.

Ans:- select title from movie where movie_status='rumoured';

13. Write a SQL query to show the name of the "United States of America" produced movie which generatedmaximum revenue.

Ans:- select movie.title from country join production_country on production_country.country_id=country.country_id join movie on production_country.movie_id=movie.movie_id where country.country_name='United States of America' order by movie.revenue desc limit 1;

14. Write a SQL query to print the movie_id in one column and name of the production company in the secondcolumn for all the movies.

Ans:- select movie_movie_id,production_company.company_name from movie join movie_company on movie_company.movie_id=movie.movie_id join production_company on movie_company.company_id=production_company.company_id;

15. Write a SQL query to show the title of top 20 movies arranged in decreasing order of their budget.

Ans:- select title from movie order by budget desc limit 20;
